

**Answer to leftover chat room question from John Lawson's Seedling Seminar Presentation, March 19, 2015**

Question: Was the charge level @ 50% before recharge?

*Answer from Bill Bennett:*

*If the question refers to the Li-air cell, I would say the air electrode was "fully" discharged in the cycles where the 2V cutoff was reached.*

*Our lab cells use a large excess of Li metal. Typically, a cycle uses only 1/1000th of the total capacity of Li.*
